Final Strategy / Recommendation Report

1. Strategic Objective

Improve user retention and app satisfaction using data-driven insights.

The final strategy integrates sentiment insights, risk modeling, and feature prioritization. Primary

Recommendation: Implement Offline Mode as the first strategic enhancement due to its high RICE

score and strong potential impact on retention. Secondary Recommendations: Improve

performance stability and reduce crash frequency. Enhance wearable integration capabilities.

Maintain continuous monitoring of sentiment trends post-release. A data-driven roadmap ensures

measurable business outcomes and sustainable product growth.

2. Feature Prioritization (RICE)

Offline Mode ranked highest due to high reach and impact.

Rest Timer and Wearable Integration follow based on calculated RICE score.

The RICE framework (Reach, Impact, Confidence, Effort) was used to prioritize features. Reach

estimates the number of users affected by the feature. Impact measures expected improvement in

user satisfaction or retention. Confidence reflects certainty of assumptions. Effort estimates

engineering resources required. Based on estimated metrics, Offline Mode ranked highest due to

high reach and strong impact potential. Rest Timer and Wearable Integration followed with

moderate priority. Dark Mode showed lower reach but minimal implementation effort. This

structured prioritization ensures optimal allocation of product development resources.

3. Product Strategy

Focus on high-impact features first.

Use phased rollout with A/B testing validation.

4. Final Recommendations

Implement Offline Mode as top priority feature.

Monitor retention metrics continuously.

Collect qualitative feedback post-release.

5. Conclusion

Data-driven prioritization ensures efficient resource allocation and measurable growth impact.
